KRAKOVSKIY, N. I.

The determination of novocain concentration in the  
urine of patients and test animals after novocaine block and  
anesthesia. N. I. Krakovskiy and P. V. Mazina. *Klin.  
Med. (U.S.S.R.)* 31, No. 11, 20-34 (1953). -- In spinal block  
the excretion (0.8-15% depending upon disease) takes place  
during the first 2 hrs. After this period there is little if  
any left, irrespective of the nature of the disease, gravity  
of the patient's condition, or the amt. of injected novocaine.  
Diuresis, enzymic processes in the body which split the  
novocaine, and the site of injection det. to a large extent the  
amt. excreted. Dogs excrete 31.5-53.7% of novocaine.  
The largest amt. is excreted during the second and third hrs.  
with the amt. of the introduced fluid affecting the output.  
The effect of the site of injection upon the amt. and speed  
of the excretory output is much more pronounced than in  
humans. The larger output in canines is partly due to the  
fact that they lack the ability to acetylate the aromatic  
amino groups of novocaine, thus retaining them in the  
body. The procedure used for the detn. of novocaine was  
Levenstein-Maxidson's method modified by K. A. M.

Content of procaine and its hydrolysis products in blood and urine after procaine block. P. N. Vorotyntseva, P. V. Mazina, and N. I. Krakovskii (A. V. Vishnevskii Inst. Surg., Acad. Med. Sci. U.S.S.R.). *Farmakol. i Toksikol.* 16, No. 6, 38-44 (1953).—Clinical detns. under procaine (I) block showed that elimination of I or of *p*-aminobenzoic acid (II) occurred in 6-7 hrs. The amt. varies with the initial rate and intensity of diuresis. Cortical block generally results in elimination of both I and II. In dogs, paranephral block was followed by elimination of I in 66% of cases, and II in some cases. The clinical detns. showed about 70% elimination of I; evidently II undergoes reactions in the body. Intravenous I in dogs is not all hydrolyzed; some is eliminated unchanged. Julian P. Smith.

1344. PROBLEMS OF CONTEMPORARY VASCULAR SURGERY (Russian text) -  
Krakovskiy N. I. - VOEN.-MED. ZH. 1957, 2 (22-28)

A literature survey describes the history of the development of vascular suture, and plastic operations on vessels with grafts of fascia, aponeuroses and abdominal muscle. Analysis is made of the pros and cons of the use of tantalum wire clips for vascular suture with the aid of a special apparatus developed by a Soviet scientist and a detailed account is given of the use of different kinds of grafts to remedy defects in vessel walls. Methods of conservation of vessels are described. (S)
